SANITARY TAPWARE
Technical document 077-04

ECAU and/or EChAU ratings for thermostatic mixer taps
CSTB (Centre Scientifique et Technique du Bâtiment), a public establishment supporting innovation in construction, has five key activities—research and expertise, assessment, certification, tests, and dissemination of knowledge—organised to meet the challenges of the ecological and energy transition in the construction sector. Their fields of expertise include construction materials, buildings and their integration into districts and towns.

With over 900 employees, its subsidiaries and networks of national, European and international partners, the CSTB group works for all the stakeholders in the construction sector to advance building quality and safety.

1 Normative support for ECAU and/or EChAU ratings

1.1 Purpose
The purpose of this chapter is to list the articles of standard NF EN 1111 - version 2017 that will be taken into account for the ECAU and/or EChAU ratings in accordance with the regulation for use DT077-00.

1.2 List of the tests involved
The table below lists the articles of the Standard NF EN 1111.

2 ECAU and/or EChAU ratings

2.1 Foreword

ECAU and/or EChAU ratings were created to meet the expectations of market players who require performances that are superior or complementary to those indicated in the NF EN 1111 standard.

For thermostatic mixers, the following are required:

- Ergonomics with special dimensions for using the tap;
- A suitable design to facilitate the cleaning of the tap;
- Resistance to alternating pressure stress against water hammer problems;
- Verification of installation system for fixed-spout single-hole taps;
- Hydraulic performance levels according to user needs;
- The safety test to limit the risk of burns;
- Constant mixed temperature according to pressure variations and variations in the hot water supply temperature, the flow rate and the initial draw-off for user comfort;
- Accuracy of the displayed temperature to compensate for differences in supply pressures;
- Water saving to avoid wasting water in certain cases of use;
- Energy saving to avoid consuming hot water in certain cases of use;
- Creation of the 3 acoustic classes to clarify this performance;
- Increased endurance performance by multiplying by 2.5 the requirements of the European standard to optimise maintenance frequencies;

It should be noted, however, that the use of these ECAU and/or EChAU ratings is voluntary and supplementary to the evaluation of a product that is already certified under the NF EN 1111 Standard.

2.2 Purpose

The purpose of this chapter is to establish the dimensional, leaktightness, hydraulic, mechanical, mechanical endurance and acoustic performance levels to be met by thermostatic mixers to qualify for ECAU and/or EChAU ratings.

2.3 Field of application

This chapter applies to thermostatic mixers subject to Standard NF EN 1111.
2.4 References to standards and additional specifications

2.5 ECAU and/or EChAU rating principle

The rating can only be assigned to taps
- pursuant to standard NF EN 1111. The test procedures are defined in Article 1 of this document.
- having passed the performance tests for the ECAU and/or EChAU ratings. The test procedures are provided in Article 2.6 below.

2.5.1 Meaning of E

The flow characteristic taken into account is the use flow 'q' of the tap as it is equipped (standard accessories: regulators, fittings, etc.).

There are 7 classes for this characteristic. See Article 2.7.1.1.

2.5.2 Meaning of C and Ch

The comfort characteristics taken into account are the dimensions, hydraulic performance and resistance to alternating pressure stress.

There are 6 classes for this characteristic. See Article 2.7.2.1.
### Field of application

<table>
<thead>
<tr>
<th>C</th>
<th>Ch</th>
</tr>
</thead>
<tbody>
<tr>
<td>− Household (house, apartment, student residence)</td>
<td>− Household with waiver (house, apartment, student residence)</td>
</tr>
<tr>
<td>− Public (Hospitality, ERP (institution receiving the public), office, EHPA (nursing home), non-medical retirement home, spa treatment centre)</td>
<td></td>
</tr>
</tbody>
</table>

### Class 1 (Note 1)

- Dimensional;
- Safety test with hot water temperature at 50°C
- Safety stop effectiveness
- Accuracy of displayed temperature
- Endurance test (number of cycles X 2.5, except for the thermostatic component)
- Resistance to alternating pressure stress
- Verification of installation system for fixed-spout single-hole taps

### Class 2 (Note 2)

- Must be C1
- Must be E0 for washbasin, bidet and sink
- Must be E1 for shower outlet
- Flow rate in water saving position;
- Inclusion of a flow control system (button or additional force to be applied or other) to obtain maximum flow from the tap.

### Class 3

- Must be C1 and C2
- Must be E0 for washbasin, bidet and sink
- Must be E1 for shower outlet
- Temperature limitation of the water at 50 °C in the maximum temperature position;
- Inclusion of a non-adjustable stop on the tap temperature control;
- Specific product marking indicating the limitation of hot water temperature to 50 °C;
- It only applies to shower, shower set, bath shower, washbasin, bidet and sink mixers

<table>
<thead>
<tr>
<th>Ch</th>
</tr>
</thead>
<tbody>
<tr>
<td>− Must be C1 (note 1) and Ch2</td>
</tr>
<tr>
<td>− Must be E00 for washbasin, bidet</td>
</tr>
<tr>
<td>− Must be E0 for shower outlet</td>
</tr>
<tr>
<td>− Controlled flow rate for water saving with a flow controller</td>
</tr>
</tbody>
</table>

### Note 1:
In cases in which the requirements of C and Ch are identical, only the letter C is used (e.g. for class 1, only C1 is used and there is no Ch1 rating)

### Note 2:
To be examined for the ECAU/EChAU rating, all tapware equipped with a “pressure point or button” system will be classified as “C2”. This means that holders may not request only a C1 rating for a product equipped with a “hard point or button” system. They must file a complementary “ECaAU” rating application.

### Note 3:
The characteristics for complying with the decree of 30 November 2005 amending the decree of 23 June 1978 on the limitation of the risk of burns are taken into account for class 3.

### 2.5.3 Meaning of A

The acoustic characteristic taken into account is the sound pressure level, $L_{ap}$.

There are 3 classes for this characteristic. See Article 2.7.3.1.
2.5.4 Meaning of U

The wear characteristic taken into account is the mechanical endurance and, more precisely, the number of operating cycles to which the following are subjected:

- Obturators;
- Temperature control
- Swivel spouts;
- Bath shower diverters.

There is 1 class for this characteristic. See Article 2.7.4.1.

An application for an ECAU and/or EChAU rating involves a class 3 application for endurance tests (U3).

2.6 Performance level for ECAU and/or EChAU ratings

2.6.1 Marking and identification

In addition to the standard NF EN 1111, for the C3 or Ch3 characteristic, the marking of the maximum temperature position of “50 °C MAX.” must be indicated.

2.6.2 Materials

No requirements in addition to those under the NF EN 1111 standard.

2.6.3 Dimensional characteristics

In addition to the NF EN 1111 Standard, the following additional dimensions must be verified: J2, D4 and P2.

- The diameter of the tapware body base (J2, established at a minimum of 45 mm) must not be obtained by introducing an insert between the base of the body and the support.
for washbasin taps, the jet axis must intersect the washbasin surface (at the tap base) at least 120 mm from the tap base axis (D4).

NOTE As the current trend is to make taps increasingly smaller, if the minimum dimensions of projections and height are combined, the suitability for use requirement is not met.

The figure below shows in dotted lines the maximum range for standard washbasins (80 mm) and for standard taps the minimum projection (100 mm, D1) with the minimum height (25 mm). It is clearly impossible to wash one's hands under the tap.

---

the spout must be separated in such a way that a rod consisting of a cylindrical segment with a 25 mm radius that is 20 mm in height and 30 mm in length of the generator can be slid onto the plane of the base. The rod must at least touch the base in the common base plane.
### 2.6.4 Test sequence

Table 7 - The test sequence under standard NF EN 1111 is supplemented to take into account the tests to be carried out on the samples for ECAU and/or EChAU ratings.

2.6.5 Protection against backflow
No requirements in addition to those under the NF EN 1111 Standard.

2.6.6 Leaktightness characteristics
No requirements in addition to those under the NF EN 1111 Standard.
2.6.7 Hydraulic characteristics

2.6.7.1 Hydraulic characteristics for class C1
In addition to the NF EN 1111 Standard, the following hydraulic characteristics must be verified:

2.6.7.1.1 Flow rate in “fully open” position (Class E)
Verification of the flow rate value obtained with class E, see Article 2.7.1.1.

2.6.7.1.2 Failure and restoration of CW supply

2.6.7.1.2.1 Principle
It consists of verifying that for the position of the control handle at the safety stop, hot water flow is negligible in the event of sudden drop in cold water pressure and is consistent with the value specified in paragraph 2.6.7.1.2.3. Flow rate is set to values (12 + 0/-1) L/min

This test is performed only on washbasin, bidet, sink and shower outlets

2.6.7.1.2.2 Operating procedure
- Supply the mixer under a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) with pre-set temperatures (for \(\theta^\circ\) Cold (13 ± 0.5) °C and for \(\theta^\circ\) Hot (50 ± 0.5) °C).
- Bring the mixed water control device to the safety stop position at a flow rate of (12 +0/-1) L/min.
- Cut off the cold water pressure abruptly (in up to 1 s).
- Recover the amount of tap water to the previous level three seconds after the cut-off over a period of 10 seconds.
- Reopen the cold water supply to the thermostatic mixer at a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) in less than 2 s and after 10 s record the temperature of the mixed water, for about 5 s.

2.6.7.1.2.3 Required characteristics
Three seconds after cutting off the cold water, the amount of water collected in 10 s must not exceed 0.1 l.

The temperature difference of the mixed water temperature after reopening the cold water and stabilisation must not exceed ± 2 K compared to the initial temperature.

2.6.7.1.3 Accuracy of displayed temperature

2.6.7.1.3.1 Principle
It consists of verifying that for the mixed water control position at the safety stop, the mixed water temperature complies with the specifications established for supply pressures of 0.3 MPa (3 bar).

This test is performed only on washbasin, bidet, sink and shower outlets

2.6.7.1.3.2 Operating procedure
- Supply the mixer under a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) with pre-set temperatures (for \(\theta^\circ\) Cold (13 ± 0.5) °C and for \(\theta^\circ\) Hot (63 ± 0.5) °C so that \(\Delta t = 50 ± 1 K\).)
- Set the temperature control device to the safety stop position and the flow control device to obtain (12 +0/-1) L/min.
- Set the temperature control device to the minimum temperature position.
- Operate the temperature control device to bring it, within up to 3 s, from the minimum temperature position to the safety stop.
- Record the average mixed water temperature 13 s after the start of the variation for approximately 7 s.
- Repeat this operation 5 times and record 5 average mixed water temperatures.
- Repeat the same test for the following supply pressures:
2.6.7.1.3.3 Required characteristics

- The temperature difference of the mixed water obtained for each type of supply pressure (5 measurements) must be less than 1 K.
- Ensure that the difference between the average $\theta_M$ temperatures of the mixed water does not exceed 2.5 K regardless of the supply pressures and without additional calibration according to the types of supply pressure.

2.6.7.1.3.4 Analysing the results

Based on the results obtained during the test, plot the average temperature $\theta_M$ curves as a function of time. Check that the average temperatures are below that indicated in the paragraph 2.6.7.1.3.3 specification.

![Figure 1 – Accuracy of displayed temperature curve](image)

2.6.7.1.4 Safety stop effectiveness

2.6.7.1.4.1 Principle

It consists of verifying the effectiveness of the safety stop. The flow rate is set to (12 + 0/-1) L/min. This test is performed only on washbasin, bidet, sink and shower outlets.

2.6.7.1.4.2 Operating procedure

See Article 13.5.6.2 of Standard NF EN 1111.

2.6.7.1.4.3 Required characteristics

The mixed water temperature before endurance must be between 37 °C and 40 °C for the 5 measurements with a difference $\leq 1 K$. 

- CWP = ((0.2 ± 0.02) MPa or (2 +0.2/0) bar)) and HWP = ((0.4 ± 0.02) MPa or (4 +0.2/0) bar))
- CWP = ((0.4 ± 0.02) MPa or (4 +0.2/0) bar)) and HWP = ((0.2 ± 0.02) MPa or (2 +0.2/0) bar))
2.6.7.2 Hydraulic characteristics for class C2
All thermostatic mixers “with a water saver” equipped with an eco button or an obturator with a pressure point shall be classified as C2.

To be examined for the ECAU rating, the “water saving” characteristic must meet the following requirements:

Taps used in a sanitary installation are subjected to a reduced flow rate when they are used for the washbasins, bidets, sinks and showers. This position may be achieved by a button or a “pressure point”. It is important for users to be able to obtain the full flow position in all cases, if they wish.

In addition to the NF EN 1111 Standard, the following hydraulic characteristics must be verified:

2.6.7.2.1 Flow rate in “WATER SAVING” position
To ensure the flow rate in the “water saving” position, it seemed advisable to use a test described in Article 13.2 of the NF EN 1111 Standard and to measure the flow rate in the “water saving” position.

2.6.7.2.1.1 Principle
It consists in determining the flow rate of the thermostatic mixer QM within a temperature range of (34 to 44) °C.

When the thermostatic mixer has several outlets, each of the outlets must comply with the flow rate requirements.

The measurement is performed on a tap by shifting from the closed position to the “water saving” position. If the tap includes standard accessories (regulators, showers, etc.), the measurement is performed by replacing them with a hydraulic resistance equivalent to the calibrated flow, as defined in Article 17.3.3 of Standard NF EN 1111.

2.6.7.2.1.2 Operating procedure
See Article 13.2.2 of Standard NF EN 1111.

2.6.7.2.1.3 Required characteristics
The flow rate value measured under 0.3 (+ 0.02/0) MPa or 3 (+ 0.2/0) bar must be for C2

- For washbasins, bidets and sinks: 4 L/min ≤ QM ≤ 6 L/min
- For the shower “outlet”: 5 L/min ≤ QM ≤ 9 L/min
2.6.7.3 Hydraulic characteristics for class C3

To be examined for the **ECAU** rating, the “Limitation of hot water temperature to 50 °C” characteristic must meet the following requirements:

- Taps used in a sanitary installation are subject to temperature limitation in the maximum temperature position when they are used for washbasins, bidets, sinks, showers and bath showers.
- To ensure the 50 °C temperature limitation, it seemed advisable to repeat some tests described in Article 13 of Standard NF EN 1111 and to measure the hot water temperature value in the maximum temperature position.
- The 50 °C setting cannot be changed by the user.
- Specific marking on the part where the temperature is set is required to indicate that the thermostatic mixer is rated “C3”. This marking is defined by the indication “50° Max or 50° Maxi”.

In addition to the NF EN 1111 Standard, the following hydraulic characteristics must be verified:

2.6.7.3.1 C3 Failure and restoration of CW supply

2.6.7.3.1.1 Principle

It consists of verifying that for the maximum temperature position of the temperature control device, hot water flow is negligible in the event of a sudden drop in cold water pressure and is consistent with the value specified in Article 2.6.7.3.1.3.

Flow rate is set to values (12 + 0/-1) L/min

This test is performed only on washbasin, bidet, sink and shower outlets

2.6.7.3.1.2 Operating procedure

- Supply the mixer under a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) with pre-set temperatures (for 0° Cold (13 ± 0.5) °C and for 0° Hot (63 ± 0.5) °C so that \( \Delta t = 50 \pm 1 \) K).
- Bring the mixed water control device to the maximum temperature position at a flow rate of (12 +0/-1) L/min.
- Cut off the cold water pressure abruptly (in up to 1 s).
- Increase the amount of tap water to the previous level three seconds after the cut-off over a period of 10 seconds.
- Reopen the cold water supply to the thermostatic mixer at a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) in less than 2 s and after 10 s record the temperature of the mixed water, for about 5 s.

2.6.7.3.1.3 Required characteristics

a) Three seconds after cutting off the cold water, the amount of water collected in 10 s shall not exceed 0.3 l.

b) The deviation of the mixed water temperature after the reopening of the cold water and stabilisation must not exceed ± 2 K compared to the initial temperature.
2.6.7.3.2 C3 Accuracy of displayed temperature

2.6.7.3.2.1 Principle
It consists of verifying that for the maximum temperature position of the temperature control device, the mixed water temperature complies with the specifications established for supply pressures of 0.3 MPa (3 bar).
The flow rate is set to (12 + 0/-1) L/min.
This test is performed only on washbasin, bidet, sink and shower outlets

2.6.7.3.2.2 Operating procedure
- Supply the mixer under a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) with pre-set temperatures (for \( \theta^\circ \) Cold (13 ± 0.5) °C and for \( \theta^\circ \) Hot (63 ± 0.5) °C so that \( \Delta t = 50 ± 1 \) K).
- Set the mixing device to the maximum temperature position, with the flow control device set to obtain (12 + 0/-1) L/min.
- Set the temperature control device to the minimum temperature position.
- Operate the temperature control device to bring it, within up to 3 s, from the minimum temperature position to the maximum temperature position.
- Record the average mixed water temperature 13 s after the start of the variation for approximately 7 s.

Repeat this operation 5 times and record 5 average mixed water temperatures.
Repeat the same test for the following supply pressures:
- CWP = ((0.2 ± 0.02) MPa or (2 +0.2/0) bar)) and HWP = ((0.4 ± 0.02) MPa or (4 +0.2/0) bar))
- CWP = ((0.4 ± 0.02) MPa or (4 +0.2/0) bar)) and HWP = ((0.2 ± 0.02) MPa or (2 +0.2/0) bar))

2.6.7.3.2.3 Required characteristics
a) The average temperature of the mixed water obtained for each operation of the temperature control device and for each type of supply pressure must not exceed 50 °C
b) The temperature difference of the mixed water obtained after the 5 operations of the temperature control device for each type of supply pressure must be less than 2 K.

2.6.7.3.2.4 Analysing the results
Based on the results obtained during the test, plot the average temperature \( \theta_M \) curves as a function of time. Check that the average temperatures are below that indicated in the paragraph 2.6.7.3.2.3 specification.

![Figure 2 – C3 Accuracy of displayed temperature curve](image-url)
2.6.7.3.3 C3 end stop effectiveness

2.6.7.3.3.1 Principle
It consists of verifying the effectiveness of the “maximum temperature” stop of the temperature control device.
The flow rate is set to \((12 + 0/-1)\) L/min.
This test is performed only on washbasin, bidet, sink and shower outlets

2.6.7.3.3.2 Operating procedure
- Shift from the minimum temperature position to the maximum temperature position.
- Supply the mixer at a pressure of \((0.3 + 0.02/0) MPa (3 + 0.2/0) bar\) at pre-set temperatures
  - For \(0^\circ\) Cold \((13 \pm 0.5) °C\) and
  - For \(0^\circ\) Hot \((63 \pm 0.5) °C\)
  - So that \(\Delta t = 50 \pm 1\) K.
- Set the flow control device to obtain \((12 + 0/-1)\) L/min.
- Record the minimum temperature position and the maximum temperature stop position.
- Operate the temperature control device to bring it, within up to 5 s, from the minimum temperature position to the maximum temperature position.
- Record the average mixed water temperature 13 s after the start of the variation for approximately 7 s.
- Repeat this operation 5 times and record 5 average mixed water temperatures.

2.6.7.3.3.3 Required characteristics
a) The mixed water temperature before or after the endurance test must be between 43 °C and 50 °C max.

2.6.7.3.4 C3 Constant temperatures \(\theta_M\) in the maximum temperature position with respect to pressure variations.

2.6.7.3.4.1 Principle
It consists of verifying that in the maximum temperature position of the temperature control device, variations in the mixed water temperature remain limited when supply pressures drop suddenly by 0.1 MPa (1 bar).
The flow rate is set to \((12 + 0/-1)\) L/min.
This test is performed only on washbasin, bidet, sink and shower outlets

2.6.7.3.4.2 Operating procedure
- Supply the tap at a pressure of \(0.3 (+ 0.02/0) MPa\) or \(3 (+ 0.2/0) bar\) at pre-set temperatures:
  - For \(0^\circ\) Cold \((13 \pm 0.5) °C\)
  - For \(0^\circ\) Hot \((63 \pm 0.5) °C\)
  - So that \(\Delta t = 50 \pm 1\) K.
- Set the mixing device to the maximum temperature position and the flow control device to obtain a flow rate of \(12 (-1/0)\) L/min.
- Record the mixed water temperature for about 15 s.
- Reduce the hot water pressure to \(0.2 (+ 0.02/0) MPa\) or \(2 (+ 0.2/0) bar\) over 1 s and record the mixed water temperature for about 15 s.
- Restore the supply of hot water to the tap at a pressure of \(0.3 (+ 0.02/0) MPa\) or \(3 (+ 0.2/0) bar\) and after 5 s record the mixed water temperature for about 15 s.
- Reduce the cold water pressure to 0.2 (+ 0.02/0) MPa or 2 (+ 0.2/0) bar over 1 s maximum and record the mixed water temperature for about 15 s.
- Restore the supply of cold water to the tap at a pressure of 0.3 (+ 0.02/0) MPa or 3 (+ 0.2/0) and after 5 s record the mixed water temperature for about 15 s.

2.6.7.3.4.3 Required characteristics
On recording the temperature of the mixed water as a function of time, ensure that:
- a) The peak temperature of the mixed water does not exceed 3 K for more than 1 s;
- b) 5 s after the start of the alteration observed in the mixed water, the average temperature of the mixed water is not greater than 50 °C;
- c) 5 s after the start of the alteration, the temperature does not vary within a range greater than ± 1.5 K;
- d) The difference in the mixed water temperature after restoring the supply of hot or cold water and the average temperature of the mixed water is not greater than 50 °C.

2.6.7.3.4.4 Analysing the results
Based on the results obtained during the tests, plot the average temperature $\theta_M$ curve as a function of time. Verify that the temperature variation of the mixed water does not exceed the values specified in paragraph 2.6.7.3.4.3.

![Graph of mixed water temperature](image)

*Figure 3 – C3 Curve of constant temperature $\theta_M$ with respect to pressure variations*
2.6.7.3.5 Constant temperatures $\theta_M$ in the maximum temperature position with respect to temperature variations.

2.6.7.3.5.1 Principle
It consists of verifying that for the maximum temperature position of the temperature control device, variations in the mixed water temperature remain limited when hot water temperature drops by 10 K within a time frame of up to 10 s.
The flow rate is set to (12 + 0/-1) L/min.
This test is performed only on washbasin, bidet, sink and shower outlets

2.6.7.3.5.2 Operating procedure
- Supply the tap at a pressure of 0.3 (+ 0.02/0) MPa or 3 (+ 0.2/0) bar at pre-set temperatures:
  - For $\theta$° Cold (13 ± 0.5) °C and
  - For $\theta$° Hot (63 ± 0.5) °C
  - So that $\Delta t = 50 ± 1$ K.
- Set the mixing device to the maximum temperature position and the flow control device to obtain a flow rate of 12 (-1/0) L/min.
- Record the average mixed water temperature for about 15 s.
- Reduce the hot water temperature by 10 K in 5 s and record the mixed water temperature for about 20 s.
- Restore the initial temperature of the hot water in less than 5 seconds and record the mixed water temperature after 8 seconds over approximately 12 seconds.

2.6.7.3.5.3 Required characteristics
- a) The peak temperature of the mixed water does not exceed 3 K for more than 1 s;
- b) 10 s after the start of the alteration observed in the mixed water, the average temperature of the mixed water is not greater than 50 ºC;
- c) 10 s after the start of the alteration, the temperature does not vary within a range greater than ± 1.5 K;
- d) The difference in the mixed water temperature restoring the hot water temperature and the average temperature of the mixed water is not greater than 50 ºC

2.6.7.3.5.4 Analysing the results
Based on the results obtained during the test, plot the average temperature $\theta_M$ curve as a function of time. Verify that the temperature variation of the mixed water does not exceed the values specified in Article 2.6.7.3.5.3 of this document.
2.6.7.3.6 C3 Initial draw-off

2.6.7.3.6.1 Principle

The principle is to make sure that after a rest period (cooled thermostatic mixer), the first draw-off does not lead to an excessive peak temperature (risk of burning) and that the mixer succeeds in stabilising itself.

2.6.7.3.6.2 Operating procedure

- Supply the tap at a pressure of 0.3 (+ 0.02/0) MPa or 3 (+ 0.2/0) bar at pre-set temperatures:
  - For $\theta^\circ$ Cold (13 ± 0.5) °C and
  - For $\theta^\circ$ Hot (63 ± 0.5) °C
  - So that $\Delta t = 50 \pm 1$ K.

- Set the mixing device to the maximum temperature position and the flow control device to obtain a flow rate of 12 (-1/0) L/min.

- Record the position of the flow control device at 12 (-1/0) l / min.

- Supply the tap at a pressure of 0.3 (+ 0.02/0) MPa or 3 (+ 0.2/0) bar at a temperature for $\theta^\circ$ Cold (13 ± 0.5) °C on the hot water supply side over (15 ± 2) s to cool the tap.

- Close the flow control device once the valve is cool.

- Supply the tap again at a pressure of 0.3 (+ 0.02/0) MPa or 3 (+ 0.2/0) bar at a temperature for $\theta^\circ$ hot (63 ± 0.5) °C on the hot water supply side without operating the flow control device.

- Move the flow control device from 0 to 12 L/min in no more than 1 to 2 s.

- Record the average mixed water temperature after the start of the variation for approximately 30 s.
2.6.7.3.6.3 Required characteristics

a) The outlet water temperature must not exceed:
   - 55 °C over more than 3 s and
   - 60 °C over more than 0.5 s.

b) The mixed water temperature must be stabilised at ± 1.5 K, 10 s after the draw-off and must not be greater than 50 °C.

Figure 5 – C3 Initial draw-off curve

2.6.7.4 Hydraulic characteristics for class Ch1

Class Ch1 is identical to class C1. Only class C1 will be selected if the thermostatic mixer meets the requirements described in Article 2.6.7.1 of this document.

2.6.7.5 Hydraulic characteristics for class Ch2

To be considered in the framework of the EChAU rating, the “water saving” characteristic must meet the following requirements:

- Taps used in a sanitary installation are subject to a controlled flow rate when they are used for washbasins, bidets, showers and bath-showers (shower outlet).

In addition to the NF EN 1111 Standard, the following hydraulic characteristics must be verified:

2.6.7.5.1 Flow rate in “fully open” position (Class E)

Verification of the flow rate value obtained with class E, see Article 2.7.1.1.
2.6.7.5.2 Ch2 Failure and restoration of CW supply

2.6.7.5.2.1 Principle
It consists of verifying that for the position of the control handle at the safety stop, water flow is negligible in the event of sudden drop in cold water pressure and is consistent with the value specified in Article 2.6.7.5.2.3 of this document. Flow is set to the maximum position.
This test is performed only on washbasin, bidet and shower outlets.

2.6.7.5.2.2 Operating procedure
- Supply the mixer at a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) at pre-set temperatures:
  - For °C Cold (13 ± 0.5) °C and
  - For °C Hot (50 ± 0.5) °C
- Bring the mixed water control device to the safety stop position at a maximum flow rate.
- Cut off the cold water pressure abruptly (in up to 1 s).
- Increase the amount of tap water to the previous level three seconds after the cut-off over a period of 10 seconds.
- Reopen the cold water supply to the thermostatic mixer at a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) in less than 2 s and after 10 s record the temperature of the mixed water, for about 5 s.

2.6.7.5.2.3 Required characteristics
a) Three seconds after cutting off the cold water, the amount of water collected in 10 s shall not exceed 0.1 l.
b) The deviation of the mixed water temperature after the reopening of the cold water and stabilisation must not exceed ± 2 K compared to the initial temperature.

2.6.7.5.3 Ch2 Accuracy of displayed temperature

2.6.7.5.3.1 Principle
It consists of verifying that for the mixed water control position at the safety stop, the mixed water temperature complies with the specifications established for supply pressures of 0.3 MPa (3 bar).
This test is performed only on washbasin, bidet and shower outlets.

2.6.7.5.3.2 Operating procedure
- Supply the mixer at a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) at pre-set temperatures:
  - For °C Cold (13 ± 0.5) °C and
  - For °C Hot (63 ± 0.5) °C
- So that Δt = 50 ± 1 K.
- Set the temperature control device to the safety stop position and the flow control device to the maximum position.
- Set the temperature control device to the minimum temperature position.
- Operate the temperature control device to bring it, within up to 3 s, from the minimum temperature position to the safety stop.
- Record the average mixed water temperature 13 s after the start of the variation for approximately 7 s.
- Repeat this operation 5 times and record 5 average mixed water temperatures.
- Repeat the same test for the following supply pressures.
2.6.7.5.3.3 Required characteristics

a) The temperature difference of the mixed water obtained for each type of supply pressure (5 measurements) must be less than 1 K.

b) Ensure that the difference between the average ($\theta_M$) temperatures of the mixed water does not exceed 2.5 K regardless of the supply pressures and without additional calibration according to the types of supply.

2.6.7.5.3.4 Analysing the results

Based on the results obtained during the test, plot the average temperature $\theta_M$ curves as a function of time. Check that the average temperatures are below that indicated in the specification of Article 2.6.7.5.3.3 of this document.

![Figure 6 – Ch2 Accuracy of displayed temperature curve](image)

2.6.7.5.4 Ch2 Safety stop effectiveness

2.6.7.5.4.1 Principle

It consists of verifying the effectiveness of the safety stop. Flow is set to the maximum position. This test is performed only on washbasin, bidet and shower outlets.

2.6.7.5.4.2 Operating procedure

- Shift from the minimum temperature position to the maximum position.
- Supply the mixer at a pressure of (0.3 ± 0.02/0) MPa ((3 ± 0.2/0) bar) at pre-set temperatures:
  - For $\theta$° Cold (13 ± 0.5) °C and
  - For $\theta$° Hot (63 ± 0.5) °C
  - So that $\Delta t = 50 ± 1$ K.
- Set the flow control device to the maximum position.
- Record the minimum temperature position and the safety stop position.
- Operate the temperature control device to bring it, within up to 5 s, from the minimum temperature position to the safety stop.
- Record the average mixed water temperature 13 s after the start of the variation for approximately 7 s. Repeat this operation 5 times and record 5 average mixed water temperatures.

2.6.7.5.4.3 Required characteristics
a) The mixed water temperature before endurance must be between 37 °C and 40 °C for the 5 measurements with a difference ≤ 1K.

2.6.7.5.5 “WATER SAVING” controlled flow rate

2.6.7.5.5.1 Principle
The purpose is to determine, for the tested tap, the value of the flow rate for reference pressures of 1.5 - 3 and 4.5 bar, also constant on each of the hot and cold water supplies. The measurement is carried out on a tap in the full flow position with mixed water between 34 and 44 °C.

2.6.7.5.5.2 Operating procedure
- Supply the tap with a dynamic pressure of 0.3 (+ 0.02/0) MPa or 3 (+ 0.2/0) bar.
- Open the flow control device in the fully open position
- Switch the temperature control device from cold to warm.
- Measure and record the flow rate values in the full flow position with a mixed water temperature between 34 and 44 °C.
- Repeat this test with dynamic pressures of 0.15 (+0.02/0) MPa or 1.5 (+ 0.2/0) bar and 0.45 (+0.02/0) MPa or 4.5 (+ 0.2/0) bar.

2.6.7.6 Hydraulic characteristics for class Ch3

To be examined for the EChAU rating, the “Limitation of hot water temperature to 50 °C” characteristic must meet the following requirements:

Mixers used in a sanitary installation are subject to temperature limitation in the maximum temperature position when they are used for washbasins, bidets, showers and bath showers (shower outlets).

The 50 °C setting cannot be changed by the user; however, the temperature stop at 50 °C can be changed by a professional for network disinfection for thermostatic mixers. This point will be verified by consulting the instructions.

Specific marking on the temperature control part is required to indicate that the thermostatic mixer is rated “Ch3”. This marking is defined by the indication “50° Max or 50° Maxi”.

In addition to the NF EN 1111 Standard and Article 2.6.7.5 of this document, the following hydraulic characteristics must be verified:

2.6.7.6.1 Ch3 Failure and restoration of CW supply in the maximum temperature position

2.6.7.6.1.1 Principle

It consists of verifying that for the maximum temperature position of the temperature control device, the water volume is negligible in the event of a sudden drop in cold water pressure and is consistent with the value specified in Article 2.6.7.6.1.3 of this document.

Flow is set to the maximum position.

2.6.7.6.1.2 Operating procedure

- Supply the mixer at a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) at pre-set temperatures:
  - For 0° Cold (13 ± 0.5) °C and
  - For 0° Hot (63 ± 0.5) °C
    - So that Δt = 50 ± 1 K.
- Bring the mixed water control device to the maximum temperature position and the flow rate device to the maximum position.
- Cut off the cold water pressure abruptly (in up to 1 s).
- Increase the amount of tap water to the previous level three seconds after the cut-off over a period of 10 seconds.
- Restore the cold water supply to the thermostatic mixer at a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) in less than 2 s and after 10 s record the temperature of the mixed water, for about 5 s.

2.6.7.6.1.3 Required characteristics

a) Three seconds after cutting off the cold water, the amount of water collected in 10 s shall not exceed 0.3 l.

b) The temperature difference of the mixed water after reopening the cold water and stabilisation must not exceed ± 2 K compared to the initial.
2.6.7.6.2 Ch3 Accuracy of displayed temperature

2.6.7.6.2.1 Principle
It consists of verifying that for the maximum temperature position of the temperature control device, the mixed water temperature complies with the specifications established for supply pressures of 0.3 MPa (3 bar) in Article 2.6.7.6.2.3 of this document.

2.6.7.6.2.2 Operating procedure
- Supply the mixer at a pressure of $(0.3 \pm 0.02/0)$ MPa ($(3 \pm 0.2/0)$ bar) at pre-set temperatures:
  - For $\theta^\circ$ Cold $(13 \pm 0.5) ^\circ$C and
  - For $\theta^\circ$ Hot $(63 \pm 0.5) ^\circ$C
  - So that $\Delta t = 50 \pm 1 \text{ K}$.
- Set the mixing device to the maximum temperature position and the flow control device in the maximum position.
- Set the temperature control device to the minimum temperature position.
- Operate the temperature control device to bring it, within up to 3 s, from the minimum temperature position to the maximum temperature position.
- Record the average mixed water temperature 13 s after the start of the variation for approximately 7 s.
- Repeat this operation 5 times and record 5 average mixed water temperatures.
- Repeat the same test for the following supply pressures:
  - CWP = ($(0.2 \pm 0.02) \text{ MPa or } (2 +0.2/0) \text{ bar})$ and HWP = ($(0.4 \pm 0.02) \text{ MPa or } (4 +0.2/0) \text{ bar})$
  - CWP = ($(0.4 \pm 0.02) \text{ MPa or } (4 +0.2/0) \text{ bar})$ and HWP = ($(0.2 \pm 0.02) \text{ MPa or } (2 +0.2/0) \text{ bar})$

2.6.7.6.2.3 Required characteristics
a) The average temperature of the mixed water obtained for each operation of the temperature control device and for each type of supply pressure must not exceed 50 °C.
b) The temperature difference of the mixed water obtained after the 5 operations of the temperature control device for each type of supply pressure must be less than 2 K.

2.6.7.6.2.4 Analysing the results
Based on the results obtained during the test, plot the average temperature $\theta_M$ curves as a function of time. Check that the average temperatures are below that indicated in the specification of Article 2.6.7.6.2.3 of this document.
2.6.7.6.3 Ch3 end stop effectiveness

2.6.7.6.3.1 Principle
It consists of verifying the effectiveness of the “maximum temperature” stop of the temperature control device. Flow is set to the maximum position.

2.6.7.6.3.2 Operating procedure
- Shift from the minimum temperature position to the maximum temperature position.
- Supply the mixer at a pressure of \((0.3 + 0.02/0)\) MPa \((3 + 0.2/0)\) bar at pre-set temperatures:
  - For \(\theta\)° Cold \((13 \pm 0.5)\) °C and
  - For \(\theta\)° Hot \((63 \pm 0.5)\) °C
  - So that \(\Delta t = 50 \pm 1\) K.
- Set the flow control device to the maximum position.
- Record the minimum temperature position and the maximum temperature stop position.
- Operate the temperature control device to bring it, within up to 5 s, from the minimum temperature position to the maximum temperature position.
- Record the average mixed water temperature 13 s after the start of the variation for approximately 7 s.
- Repeat this operation 5 times and record 5 average mixed water temperatures.

2.6.7.6.3.3 Required characteristics
The mixed water temperature before or after the endurance test must be between 43 °C and 50 °C max.

2.6.7.6.4 Ch3 Constant temperatures \(\theta_m\) in the maximum temperature position with respect to pressure variations.

2.6.7.6.4.1 Principle
It consists of verifying that in the maximum temperature position of the temperature control device, variations in the mixed water temperature remain limited when supply pressures drop suddenly by 0.1 MPa \((1\) bar).
Flow is set to the maximum position.
2.6.7.6.4.2 Operating procedure
- Supply the mixer at a pressure of \((0.3 + 0.02/0)\) MPa \((3 + 0.2/0)\) bar at pre-set temperatures:
  - For \(\theta^\circ\) Cold \((13 \pm 0.5)\) °C and
  - For \(\theta^\circ\) Hot \((63 \pm 0.5)\) °C
  - So that \(\Delta t = 50 \pm 1\) K.
- Set the mixing device to the maximum temperature position and the flow control device in the maximum position.
- Record the mixed water temperature for about 15 s.
- Reduce the hot water pressure to \((0.2 + 0.02/0)\) MPa or \((2 + 0.2/0)\) bar over 1 s and record the mixed water temperature for about 15 s.
- Restore the supply of hot water to the mixer at a pressure of \((0.3 + 0.02/0)\) MPa \((3 + 0.2/0)\) bar and after 5 s record the mixed water temperature for about 15 s.
- Reduce the cold water pressure to \((0.2 + 0.02/0)\) MPa or \((2 + 0.2/0)\) bar over 1 s and record the mixed water temperature for about 15 s.
- Restore the supply of cold water to the mixer at a pressure of \((0.3 + 0.02/0)\) MPa \((3 + 0.2/0)\) bar and after 5 s record the mixed water temperature for about 15 s.

2.6.7.6.4.3 Required characteristics
On recording the temperature \(\theta_M\) of the mixed water as a function of time, ensure that:
- a) The peak temperature of the mixed water does not exceed 3 K for more than 1 s;
- b) 5 s after the start of the alteration observed in the mixed water, the average temperature of the mixed water is not greater than 50 °C;
- c) 5 s after the start of the alteration, the temperature does not vary within a range greater than \(\pm 1.5\) K;
- d) The difference in the mixed water temperature after restoring the supply of hot or cold water and the average temperature of the mixed water is not greater than 50 °C.

2.6.7.6.4.4 Analysing the results
Based on the results obtained during the tests, plot the average temperature \(\theta_M\) curve as a function of time. Verify that the temperature variation of the mixed water does not exceed the values specified in Article 2.6.7.6.4.3 of this document.

![Figure 8 – Ch3 Curve of constant temperature \(\theta_M\) with respect to pressure variations](image-url)

2.6.7.6.5 Ch3 Constant temperatures \(\theta_M\) in the maximum temperature position with respect to temperature variations.
2.6.7.6.5.1 Principle
It consists of verifying that for the maximum temperature position of the temperature control device, variations in the mixed water temperature remain limited when hot water temperature drops by 10 K within a time frame of up to 10 s.

2.6.7.6.5.2 Operating procedure
- Supply the mixer at a pressure of (0.3 + 0.02/0) MPa ((3 + 0.2/0) bar) at pre-set temperatures:
  - For \( \theta \text{° Cold} \) (13 ± 0.5) °C and
  - For \( \theta \text{° Hot} \) (63 ± 0.5) °C
  - So that \( \Delta t = 50 \pm 1 \) K.
- Set the mixing device to the maximum temperature position and the flow control device in the maximum position.
- Record the average mixed water temperature for about 15 s.
- Reduce the hot water temperature by 10 K in less than 10 s and record the mixed water temperature for about 20 s.
- Restore the initial temperature of the hot water in less than 10 seconds and record the mixed water temperature after 10 seconds over approximately 12 seconds.

2.6.7.6.5.3 Required characteristics
On recording the temperature of the mixed water \( (\theta_M) \) as a function of time, ensure that:

a) The peak temperature of the mixed water does not exceed 3 K for more than 1 s;
b) 10 s after the start of the alteration observed in the mixed water, the average temperature of the mixed water is not greater than 50 °C;
c) 10 s after the start of the alteration, the temperature does not vary within a range greater than ± 1.5 K;
d) The difference in the mixed water temperature restoring the hot water temperature and the average temperature of the mixed water is not greater than 50 °C.

2.6.7.6.5.4 Analysing the results
Based on the results obtained during the test, plot the average temperature \( \theta_M \) curve as a function of time. Verify that the temperature variation of the mixed water does not exceed the values specified in Article 2.6.7.6.5.3 of this document.
2.6.7.6.6 Ch3 Initial draw-off

2.6.7.6.6.1 Principle
The principle is to make sure that after a rest period (cooled thermostatic mixer), the first draw-off does not lead to an excessive peak temperature (risk of burning) and that the mixer succeeds in stabilising itself.

2.6.7.6.6.2 Operating procedure
- Supply the mixer at a pressure of \((0.3 + 0.02/0)\) MPa \((3 + 0.2/0)\) bar at pre-set temperatures:
  - For \(\theta\)° Cold \((13 \pm 0.5)\) °C and
  - For \(\theta\)° Hot \((63 \pm 0.5)\) °C
  - So that \(\Delta t = 50 \pm 1\) K.
- Set the mixing device to the maximum temperature position and the flow control device in the maximum position.
- Record the flow control device position at the maximum position.
- Supply the mixer at a pressure of \((0.3 + 0.02/0)\) MPa \((3 + 0.2/0)\) bar at a temperature for \(\theta\)° Cold \((13 \pm 0.5)\) °C on the hot water supply side over \((15 \pm 2)\) s to cool the mixer.
- Close the flow control device once the mixer is cool.
- Supply the mixer again at a pressure of \((0.3 + 0.02/0)\) MPa \((3 + 0.2/0)\) bar at a temperature for \(\theta\)° hot \((63 \pm 0.5)\) °C on the hot water supply side without operating the flow control device.
- Operate the flow control device from 0 to the maximum flow rate in up to 1 to 2 s.
- Record the average mixed water temperature after the start of the variation for approximately 30 s.

2.6.7.6.6.3 Required characteristics
a) The outlet water temperature must not exceed:
  - 55 °C over more than 3 s and
b) The mixed water temperature must be stabilised at $\pm 1.5$ K, 10 s after the draw-off and must not be greater than 50 °C.

Figure 10 – Ch3 Initial draw-off curve

2.6.7.7 Required characteristics after mechanical endurance of the temperature control system

2.6.7.7.1 Required characteristics for class C1 and/or Ch1

After 50,000 cycles for the temperature control system, the following requirements are established:

- Leaktightness requirements (Articles 12.2 and 12.3 of standard NF EN 1111);
- The following hydraulic requirements under standard NF EN 1111:
  - Article 13.3 (Sensitivity): No change in the characteristics required in the standard.
  - Article 13.4 (Reliability): The required characteristic is increased from 1 K to 2 K.
  - Article 13.5.2 (Flow reduction): No change in the characteristics required in the standard.
  - Article 13.5.3 (Failure and restoration of cold water supply): No change in the characteristics required in the standard.
  - Article 13.5.4 (Variation of supply pressure): No change in the characteristics required in the standard.
  - Article 13.5.6 (Retractable temperature stops): No change in the characteristics required in the standard.
- The following hydraulic requirements (for Class C1) under this document:
  - Article 2.6.7.1.2 (Failure and restoration of CW supply): No change in the characteristics required under this document.
  - Article 2.6.7.1.3 (Accuracy of displayed temperature): The characteristic required under this document is increased from 2.5 K to 3 K.
  - Article 2.6.7.1.4 (Safety stop effectiveness): The characteristic required under this document is increased from (37 °C and 40 °C) to (37 °C and 42 °C).
2.6.7.7.2 Characteristics required for class C2

After 50,000 cycles for the temperature control system, the following requirements are established:

- Leaktightness requirements (Articles 12.2 and 12.3 of standard NF EN 1111);
- The following hydraulic requirements under standard NF EN 1111:
  - Article 13.3 (Sensitivity): No change in the characteristics required in the standard.
  - Article 13.4 (Reliability): The required characteristic is increased from 1 K to 2 K.
  - Article 13.5.2 (Flow reduction): No change in the characteristics required in the standard.
  - Article 13.5.3 (Failure and restoration of cold water supply): No change in the characteristics required in the standard.
  - Article 13.5.4 (Variation of supply pressure): No change in the characteristics required in the standard.
  - Article 13.5.6 (Retractable temperature stops): No change in the characteristics required in the standard.

- The following hydraulic requirements (for Class C1) under this document:
  - Article 2.6.7.1.2 (Failure and restoration of CW supply): No change in the characteristics required under this document.
  - Article 2.6.7.1.3 (Accuracy of displayed temperature): The characteristic required under this document is increased from 2.5 K to 3 K.
  - Article 2.6.7.1.4 (Safety stop effectiveness): The characteristic required under this document is increased from (37 °C and 40 °C) to (37 °C and 42 °C).

- The following hydraulic requirements (for Class C2) under this document:
  - No specific test after the endurance test in the thermostatic component.
2.6.7.3 Characteristics required for class C3

After 50,000 cycles for the temperature control system, the following requirements are established:

- Leaktightness requirements (Articles 12.2 and 12.3 of Standard NF EN 1111);
- The following hydraulic requirements under Standard NF EN 1111:
  - Article 13.3 (Sensitivity): No change in the characteristics required in the standard.
  - Article 13.4 (Reliability): The required characteristic is increased from 1 K to 2 K.
  - Article 13.5.2 (Flow reduction): No change in the characteristics required in the standard.
  - Article 13.5.3 (Failure and restoration of cold water supply): No change in the characteristics required in the standard.
  - Article 13.5.4 (Variation of supply pressure): No change in the characteristics required in the standard.
  - Article 13.5.6 (Retractable temperature stops): No change in the characteristics required in the standard.
- The following hydraulic requirements (for Class C1) under this document:
  - Article 2.6.7.1.2 (Failure and restoration of CW supply): No change in the characteristics required under this document.
  - Article 2.6.7.1.3 (Accuracy of displayed temperature): The characteristic required under this document is increased from 2.5 K to 3 K.
  - Article 2.6.7.1.4 (Safety stop effectiveness): The characteristic required under this document is increased from (37 °C and 40 °C) to (37 °C and 42 °C).
- The following hydraulic requirements (for Class C2) under this document:
  - No specific test after the endurance test in the thermostatic component.
- The following hydraulic requirements (for Class C3) under this document:
  - Article 2.6.7.3.1 (C3 Failure and restoration of CW supply): No change in the characteristics required under this document.
  - Article 2.6.7.3.3 (C3 end stop effectiveness): No change in the characteristics required under this document.
  - Article 2.6.7.3.4 (C3 Constant temperatures \( \theta_M \) in the maximum temperature position with respect to pressure variations.): No change in the characteristics required under this document.
  - Article 2.6.7.3.6 (C3 Initial draw-off): No change in the characteristics required under this document.

2.6.7.4 Characteristics required for class Ch1

After 50,000 cycles for the temperature control system, the following requirements are established:

- Leaktightness requirements (Articles 12.2 and 12.3 of standard NF EN 1111);
- The following hydraulic requirements under standard NF EN 1111:
  - Article 13.3 (Sensitivity): No change in the characteristics required in the standard.
  - Article 13.4 (Reliability): The required characteristic is increased from 1 K to 2 K.
  - Article 13.5.2 (Flow reduction): No change in the characteristics required in the standard.
  - Article 13.5.3 (Failure and restoration of cold water supply): No change in the characteristics required in the standard.
- Article 13.5.4 (Variation of supply pressure): No change in the characteristics required in the standard.
- Article 13.5.6 (Retractable temperature stops): No change in the characteristics required in the standard.

The following hydraulic requirements (for Class C1/Ch1) under this document:
- Article 2.6.7.1.2 (Failure and restoration of CW supply): No change in the characteristics required under this document.
- Article 2.6.7.1.3 (Accuracy of displayed temperature): The characteristic required under this document is increased from 2.5 K to 3 K.
- Article 2.6.7.1.4 (Safety stop effectiveness): The characteristic required under this document is increased from (37 °C and 40 °C) to (37 °C and 42 °C).

2.6.7.7.5 Characteristics required for class Ch2
After 50,000 cycles for the temperature control system, the following requirements are established:
- Leaktightness requirements (Articles 12.2 and 12.3 of Standard NF EN 1111);
- The following hydraulic requirements under Standard NF EN 1111:
  - Article 13.3 (Sensitivity): No change in the characteristics required in the standard.
  - Article 13.4 (Reliability): The required characteristic is increased from 1 K to 2 K
  - Article 13.5.2 (Flow reduction): No change in the characteristics required in the standard.
  - Article 13.5.3 (Failure and restoration of cold water supply): No change in the characteristics required in the standard.
  - Article 13.5.4 (Variation of supply pressure): No change in the characteristics required in the standard.
  - Article 13.5.6 (Retractable temperature stops): No change in the characteristics required in the standard.

The following hydraulic requirements under this document:
- Article 2.6.7.5.2 (Ch2 Failure and restoration of CW supply): No change in the characteristics required under this document.
- Article 2.6.7.5.3 (Ch2 Accuracy of displayed temperature): The characteristic required under this document is increased from 2.5 K to 3 K.
- Article 2.6.7.5.4 (Ch2 Safety stop effectiveness): The characteristic required under this document is increased from (37 °C and 40 °C) to (37 °C and 42 °C).

The following hydraulic requirements (for Class Ch2) under this document:
- No specific test after the endurance test in the thermostatic component.
2.6.7.7.6 Characteristic required for class Ch3

After 50,000 cycles for the temperature control system, the following requirements are established:

- Leaktightness requirements (Articles 12.2 and 12.3 of standard NF EN 1111);
- The following hydraulic requirements under standard NF EN 1111:
  o Article 13.3 (Sensitivity): No change in the characteristics required in the standard.
  o Article 13.4 (Reliability): The required characteristic is increased from 1 K to 2 K.
  o Article 13.5.2 (Flow reduction): No change in the characteristics required in the standard.
  o Article 13.5.3 (Failure and restoration of cold water supply): No change in the characteristics required in the standard.
  o Article 13.5.4 (Variation of supply pressure): No change in the characteristics required in the standard.
  o Article 13.5.6 (Retractable temperature stops): No change in the characteristics required in the standard.
- The following hydraulic requirements under this document:
  o Article 2.6.7.5.2 (Ch2 Failure and restoration of CW supply): No change in the characteristics required under this document.
  o Article 2.6.7.5.3 (Ch2 Accuracy of displayed temperature): The characteristic required under this document is increased from 2.5 K to 3 K.
  o Article 2.6.7.5.4 (Ch2 Safety stop effectiveness): The characteristic required under this document is increased from (37 °C and 40 °C) to (37 °C and 42 °C).
- The following hydraulic requirements (for Class Ch2) under this document:
  o No specific test after the endurance test in the thermostatic component.
- The following hydraulic requirements (for Class Ch3) under this document:
  o Article 2.6.7.6.1 (Ch3 Failure and restoration of CW supply in the maximum temperature position): No change in the characteristics required under this document.
  o Article 2.6.7.6.3 (Ch3 end stop effectiveness): No change in the characteristics required under this document.
  o Article 2.6.7.6.4 (Ch3 Constant temperatures \( t_M \) in the maximum temperature position with respect to pressure variations.): No change in the characteristics required under this document.
  o Article 2.6.7.6.6 (Ch3 Initial draw-off): No change in the characteristics required under this document.

2.6.8 Pressure resistance characteristics - Mechanical behaviour under pressure

No requirements in addition to those under the NF EN 1111 Standard.

2.6.9 Mechanical strength characteristics - Operating device torque test.

No requirements in addition to those under the NF EN 1111 Standard.

2.6.10 Mechanical endurance characteristics

Endurance performance is modified by multiplying by 2.5 the requirements for all mobile equipment under the Standard NF EN 1111, with the exception of the temperature control system which remains at 50,000 cycles.
2.6.11 Acoustic characteristics

Tapware with Lap > 30 cannot be admitted for these ECAU and/or EChAU ratings
Verification of the acoustic value obtained with class A; see article 2.7.3.1.

2.6.12 Resistance to alternating pressure stress

To be examined for the ECAU and/or EChAU ratings, thermostatic mixers must meet the following requirements:

- Thermostatic mixers used in a sanitary installation are subject to considerable pressure variations due to the closing of installed devices - solenoid valves of washing machines, mixers, valves, etc.
- To ensure their resistance to such stress, it seemed advisable to use a test described in the T 54-094 standard for the rating of supply hoses and piping components.

2.6.12.1 Test principle

Application during 200 cycles of a variable and defined internal hydraulic pressure at the thermostatic mixer inlets, with the thermostatic mixer in the closed position.

2.6.12.2 Equipment

The equipment essentially includes:

A pressure generator capable of generating variable pressure that can vary at constant frequency between a low limit and a high limit, establishing constant amplitude. The diagram of that variation takes the form of a generally rectangular signal (see Figure 11).

![Figure 11](chart.png)

- The time needed to shift from low pressure to high pressure and vice versa must be as short as possible and never longer than one-tenth of the period;
- The low and high pressure values must be obtained and checked to within ± 2% of the desired values;
- To check the waveform of the signal representing the pressure variation, the generator must be combined with a device that can verify the pressure changes in the test specimen (low-inertia pressure sensor and graphic data recorder or oscilloscope).

2.6.12.3 Operating procedure

Apply 100 cycles to the closed tap (filled with water and cleared of air):

- Low pressure of (8 ± 1) bar;
- High pressure of (50 ± 1) bar;
- Frequency of (1 ± 0.5) Hertz.
1) On one of the inlets, (the other being in the open air);
2) On the other inlet.

Note: A "slight" leak is allowed during the test if it does not have an influence on the low and high pressures of the test.

After the alternating pressure test, perform the leak test in accordance with Article 12.2 of standard NF EN 1111.

2.6.12.4 Required characteristics
During the leak test, no visible deterioration or leakage should be observed.

2.6.13 Verification of the installation system for sanitary tapware

In view of the lack of a tightening system verification test under standard NF EN 1111 for single-hole taps with a fixed spout (washbasin, bidet and bathtub) which are installed on horizontal planes, it is necessary to verify tightening performance according to the following steps:

2.6.13.1 Test principle
The test consists of verifying the tightening behaviour by applying a specific force to the end of the tapware spout.

2.6.13.2 Test method
The test is performed by conducting the following operations:

- Install the tapware on the test plate;
- Tighten the nut of the tap installation system to a torque of 7 (−0.5/0) N.m (if the installation system does not have a nut, tighten the installation system by hand);
- Apply a force of 98 (+2/0) N at the end of the spout (the point at which the force is to be applied is located on the axis of the aerator);
- Maintain the force during (60 ± 5) s;
- Verify any rotation of the tapware;

2.6.13.3 Requirements
There should be no rotation of the tapware during the test.

2.6.13.4 Frequency
The tightening test is carried out when new products are admitted and/or when one of the components of the tapware installation system and/or the tapware component in contact with the table is modified.
2.7 ECAU and/or EChAU ratings for thermostatic mixer taps

The essential principle of ECAU and/or EChAU ratings is that the different characteristics are independent of one another. The level of each characteristic is to be selected as needed.

2.7.1 Hydraulic or flow characteristic

2.7.1.1 Classification

Depending on their performance level, tapware can be classified as follows:

<table>
<thead>
<tr>
<th>Class</th>
<th>Flow rate value</th>
</tr>
</thead>
<tbody>
<tr>
<td>E0</td>
<td>9 L/min ≤ q &lt; 12 L/min</td>
</tr>
<tr>
<td>E1</td>
<td>12 L/min ≤ q &lt; 16 L/min</td>
</tr>
<tr>
<td>E2</td>
<td>16 L/min ≤ q &lt; 20 L/min</td>
</tr>
<tr>
<td>E3</td>
<td>20 L/min ≤ q &lt; 25.2 L/min</td>
</tr>
<tr>
<td>E4</td>
<td>25.2 L/min ≤ q</td>
</tr>
</tbody>
</table>

Performance for class C2 (flow rate at pressure point or button)

<table>
<thead>
<tr>
<th>Class</th>
<th>Flow rate value</th>
<th>Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>E00</td>
<td>4 L/min ≤ q ≤ 6 L/min</td>
<td>Washbasin, Bidet and Sink</td>
</tr>
<tr>
<td>E02</td>
<td>5 L/min ≤ q &lt; 9 L/min</td>
<td>Shower</td>
</tr>
</tbody>
</table>

Performance for class Ch2 (flow rate with a flow controller)

<table>
<thead>
<tr>
<th>Class</th>
<th>Flow rate value</th>
<th>Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>E00</td>
<td>4 L/min ≤ q ≤ 6 L/min</td>
<td>Washbasin and Bidet</td>
</tr>
<tr>
<td>E0</td>
<td>9 L/min ≤ q &lt; 12 L/min</td>
<td>Shower</td>
</tr>
</tbody>
</table>

NOTE For bathtub tapware, the minimum class is E3
Depending on their level of performance, the valves have a score of type A, B, C, D.

Bath-shower / shower faucets

<table>
<thead>
<tr>
<th>Flow rate at 3 bar (L/min.)</th>

</table>

### 2.7.1.2 Selection criteria
Flow rate class selection will be based on: the supplied device; the building comfort level; the type of room to be equipped.
### 2.7.2 Comfort characteristics

#### 2.7.2.1 Classification

Depending on their performance level, tapware can be classified as follows:

<table>
<thead>
<tr>
<th>Class</th>
<th>The tap must comply with the requirements of the following articles</th>
</tr>
</thead>
</table>
| C1 (Note 1) | §2.6.3 Dimensional characteristics  
§2.6.7.1 Hydraulic characteristics for class C21  
§2.6.12 Resistance to alternating pressure stress  
§2.6.13 Verification of installation system for fixed-spout single-hole taps |
| C2 | Meets the requirements of Class C1  
§2.6.7.2 Hydraulic characteristics for class C2 |
| C3 | Meets the requirements of Classes C1 and C2  
§2.6.7.3 Hydraulic characteristics for class C3 |
| Ch1 | See C1 (note 1) |
| Ch2 | Meets the requirements of Class C1 (Note 1)  
§2.6.7.5 Hydraulic characteristics for class Ch2 |
| Ch3 | Meets the requirements of Classes C1 (Note 1) and Ch2  
§2.6.7.6 Hydraulic characteristics for class Ch3 |

**Note 1:** In cases in which the requirements of C and Ch are identical, only the letter C is used (e.g. for class 1, only C1 is used and there is no Ch1 rating)

Depending on their level of performance, the valves have a score of type A, B, C, D.

**Performance criterion C depends on the tapware design:**

<table>
<thead>
<tr>
<th>Rating</th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>Technical score</td>
<td>C3</td>
<td>Ch3</td>
<td>C2</td>
<td>Ch2</td>
</tr>
</tbody>
</table>

- **Ergonomic faucets**
  - Resistant to water hammers
  - With water saving system
- **For mechanical and electronic mixing valves**
  - One cold water opening mechanism
- **For thermostatic mixing valves**
  - One temperature regulation mechanism  
  + One 50°C temperature limitation mechanism

- Ergonomic faucets
  - Resistant to water hammers
  - With water saving system

- For all faucets (except mixers)
  - C2 = one Full flow mech. + one Flow mech. limited to 50%
  - Ch2 = one Flow mech. limited to 50% only

- Ergonomic faucets
  - Resistant to water hammers

- Ergonomics of control lever and spout, ease of cleaning, etc.
2.7.2.2 Selection criteria
The comfort class selection will mainly depend on the characteristics and use of the building.

2.7.3 Acoustic characteristic

2.7.3.1 Classification
Depending on their performance level, tapware can be classified as follows:

<table>
<thead>
<tr>
<th>Acoustic group</th>
<th>Class</th>
<th>Lap</th>
</tr>
</thead>
<tbody>
<tr>
<td>II</td>
<td>A1</td>
<td>20 dB (A) &lt; Lap ≤ 30 dB (A)</td>
</tr>
<tr>
<td>I</td>
<td>A2</td>
<td>15 dB (A) &lt; Lap ≤ 20 dB (A)</td>
</tr>
<tr>
<td>I</td>
<td>A3</td>
<td>Lap ≤ 15 dB (A)</td>
</tr>
</tbody>
</table>

Depending on their level of performance, the valves have a score of type A, B, C, D.

2.7.3.2 Selection criteria
The acoustic class selection will mainly depend on the characteristics and use of the building.

2.7.4 Mechanical endurance or wear resistance characteristic

2.7.4.1 Classification
Depending on the actual level of wear resistance of its various components, tapware can be classified as follows:

<table>
<thead>
<tr>
<th>Class</th>
<th>Number of cycles</th>
</tr>
</thead>
<tbody>
<tr>
<td>U1</td>
<td>Temperature control: 50 000 cycles</td>
</tr>
<tr>
<td></td>
<td>Obturator: 200 000 cycles</td>
</tr>
<tr>
<td></td>
<td>Swivel spout: 80 000 cycles</td>
</tr>
<tr>
<td></td>
<td>Bath shower diverter: 30 000 cycles</td>
</tr>
<tr>
<td>U2</td>
<td>Temperature control: 50 000 cycles</td>
</tr>
<tr>
<td></td>
<td>Obturator: 350 000 cycles</td>
</tr>
<tr>
<td></td>
<td>Swivel spout: 140 000 cycles</td>
</tr>
<tr>
<td></td>
<td>Bath shower diverter: 50 000 cycles</td>
</tr>
<tr>
<td>U3</td>
<td>Temperature control: 50,000 cycles</td>
</tr>
<tr>
<td></td>
<td>Obturator: 500,000 cycles</td>
</tr>
<tr>
<td></td>
<td>Swivel spout: 200,000 cycles</td>
</tr>
<tr>
<td></td>
<td>Bath shower diverter: 80,000 cycles</td>
</tr>
</tbody>
</table>

Depending on their level of performance, the valves have a score of type A, B, C, D.
Performance criterion U corresponds to the service life of moving parts of the faucet:

<table>
<thead>
<tr>
<th>Rating</th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>Technical score</td>
<td>U3</td>
<td>U2</td>
<td>U1</td>
<td>U0</td>
</tr>
<tr>
<td>Rotating valve</td>
<td>500,000</td>
<td>350,000</td>
<td>200,000</td>
<td>&lt; 200,000</td>
</tr>
<tr>
<td>Mechanical cartridge</td>
<td>175,000</td>
<td>122,500</td>
<td>70,000</td>
<td>&lt; 70,000</td>
</tr>
<tr>
<td>Automatic diverter</td>
<td>80,000</td>
<td>50,000</td>
<td>30,000</td>
<td>&lt; 30,000</td>
</tr>
<tr>
<td>Spout</td>
<td>200,000</td>
<td>140,000</td>
<td>80,000</td>
<td>&lt; 80,000</td>
</tr>
</tbody>
</table>

2.7.4.2 Selection criteria
For thermostatic mixers, only class U3 is possible.
U3: intensive use and use in harsh conditions.

2.8 Example of ECAU and/or EChAU ratings
Bath shower tapware with:
A flow rate during use of 24 L/min (bath outlet) and 13 L/min (shower outlet), that passes comfort level 1 tests, with an Lₚ of 18 dB (A) and that passes the endurance tests (500,000 cycles (obturator) - 80,000 cycles (diverter) – 50,000 cycles (temperature control)) will be classified as:
**E3/1 C1 A2 U3**

Shower tapware with:
A flow rate during use of 10 L/min, that passes comfort level 3 tests, with an Lₚ of 15 dB (A) and that passes the endurance tests (500,000 cycles (obturator) - 50,000 cycles (temperature control)) will be classified as:
**E00 Ch3 A3 U3**
2.9 Rating presentation

2.9.1 Specific information for the catalogue or other commercial media

See Chapter 6.1 of the regulations for use of DT077-00.

The specific information on the methods for rating thermostatic mixing valves are as follows:

<table>
<thead>
<tr>
<th>Flow</th>
<th>E</th>
<th>Q L/min measured under 3 bar</th>
<th>E00</th>
<th>4 L/min ≤ Q ≤ 6 L/min</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E02</td>
<td>5 L/min ≤ Q &lt; 9 L/min</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>E0</td>
<td>9 L/min ≤ Q &lt; 12 L/min</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>E1</td>
<td>12 L/min ≤ Q &lt; 16 L/min</td>
<td></td>

2.9.2 Product information

See Chapter 6.2 of the regulations for use of DT077-00.
3 ECAU and/or EChAU rating application.

The rating application must be issued by the applicant/holder in one copy (1 original on the applicant’s letterhead paper in French or English) according to the cases and models indicated below. All the documents are to be remitted to CSTB.

In the event that the product comes from a manufacturing unit located outside the European Economic Area, the applicant shall designate a representative within the European Economic Area who co-signs the application.

Note: Electronic versions of template letters and sheets may be obtained from CSTB.

The applicant produces a file that contains the elements described in the following table depending on the type of application.

<table>
<thead>
<tr>
<th>Type of application</th>
<th>Initial application</th>
<th>Complementary application</th>
<th>Admission following a penalty of withdrawal</th>
<th>Suspension application</th>
<th>Renunciation application</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elements</td>
<td>Application and commitment letter</td>
<td>Standard letter 1A or 1B (for a representative)</td>

<td>Standard sheet 7 specific items</td>
<td>Standard letter 5A or 5B (for a representative)</td>
</tr>
<tr>
<td>Sales literature</td>
<td>YES</td>
<td>If applicable</td>
<td>YES</td>
<td>Instructions or extract from the catalogue</td>
<td></td>
</tr>
</tbody>
</table>

3.1 For an initial rating application

The applicant shall prepare a dossier which includes:
- an application and commitment letter in accordance with standard letter 1 A;
- if a representative, application and commitment letter as per standard letter 1 B;

3.2 For a complementary rating application

The holder shall prepare a file containing the following:
- an application and commitment letter in accordance with standard letter 2 A;
- if representative, application and commitment letter as per standard letter 2 B;

3.3 For a new rating application following a penalty of withdrawal of ECAU and/or EChAU ratings

The holder shall prepare a file containing the following:
- specific items that all applicants must submit as part of a new admission application where the right of use has been withdrawn as a result of a sanction, using standard sheet 7.

3.4 For an application for the suspension of the ECAU and/or EChAU rating

The holder shall prepare a file containing the following:
- a suspension letter as per standard letter 5 A;
- if a representative, a suspension letter as per standard letter 5 B.
3.5 For an application for renunciation of the ECAU and/or EChAU rating

The holder shall prepare a file containing the following:
- a renunciation letter as per standard letter 6A;
- **if a representative**, a renunciation letter as per standard letter 6B.
STANDARD LETTER 1A

Subject: ECAU and/or EChAU rating admission application
Attachment(s): a technical file.

Dear Sir, Madam,

I would like to request an ECAU and/or EChAU rating:

- for the following product/range of products: ………… (detailed list of the product/range of products or specify “as set out in the list included with this application”);
- produced at the following production unit: ………… (company name, address);
- and for the following trade name: ………… (trademark and/or specific trade reference, which may be on the list included with this application).

For this purpose, I declare that I have read and accept technical document 077-03 and undertake to comply with it and to inform my commercial network during the entire validity period of the ECAU and/or EChAU rating and in particular to comply without restrictions or reservations with the decisions made by CSTB.

Yours faithfully,

Date, signature and name in full of the applicant/holder’s legal representative
Subject: ECAU and/or EChAU rating admission application (with a representative)  
Attachment(s): a technical file.

Dear Sir, Madam,

I would like to request an ECAU and/or EChAU rating:

- for the following product/range of products: …………… (detailed list of the product/range of products or specify "as set out in the list included with this application");
- produced at the following production unit: …………… (company name, address);
- and for the following trade name: …………… (trademark and/or specific trade reference, which may be on the list included with this application).

For this purpose, I declare that I have read and accept technical document 077-03 and undertake to comply with it and to inform my commercial network during the entire validity period of the ECAU and/or EChAU rating and in particular to comply without restrictions or reservations with the decisions made by CSTB.

Furthermore, I appoint the Company …………… (company name), …………… (company legal form), …………… (registered office) represented by Mr/Ms …………… (name of the legal representative) in that person’s capacity as …………… (position) to represent me in the European Economic Area for all matters relative to ECAU and/or EChAU ratings.

I undertake to immediately notify CSTB of any new appointment of the representative designated above.

In this regard, I request that the expenses that are to be borne by me be invoiced directly to the representative. They will make the payments on my behalf and in my name as soon as the invoices are received, as agreed when accepting the role of representative.

Yours faithfully,

Subject: Complementary application for the ECAU and/or EChAU rating  

Attachment(s): a technical file.

Dear Sir, Madam,

As holder of the ECAU and/or EChAU rating for the product(s) of our manufacture identified below:

- designation of the product(s): ............
- production unit: ............
- right of use granted on ............ (date) and bearing the following number: ............ (number of valid certificate)

I am writing to apply for the ECAU and/or EChAU rating for the following product/range of products that we manufacture:

- detailed list of the product/range of products: ............
- specific trade reference: ............

(This information may be included in a list attached to this application)

For an extension application, please provide the information below:

This product deviates from the certified product/range of products due to the following modifications: ............ <description of the modifications>.

The product/range of products for which I am seeking an extension will replace the certified product listed above:

- NO (1);
- YES (1).

I declare that the products/product range covered by this application are, with relation to the other characteristics, strictly in conformity with the products/product range already certified and manufactured under the same conditions.

For this purpose, I declare that I have read and accept technical document 077-03 and undertake to comply with it and to inform my commercial network during the entire validity period of the ECAU and/or EChAU rating and in particular to comply without restrictions or reservations with the decisions made by CSTB.

Yours faithfully,

Date, signature and name in full  
of the applicant/holder’s legal representative

4 Prices

The purpose of this chapter is to determine the amount due for services related to the ECAU and EChAU ratings and describe the terms of payment.

The ECAU and EChAU ratings include the following services:

- Development, examination of application and implementation of ECAU and/or EChAU ratings;
- Operation of ECAU and/or EChAU ratings;
- Testing;

The laboratories’ price lists are provided upon request.
The applicant/holder supplies samples free of charge and makes them available at the laboratory’s address.
The costs related to the import duties and taxes are to be borne by the test applicant; the applicant shall pay all duties and taxes before sending the samples.

- Initial/complementary application: See § 4.2.1
- Monitoring: See § 4.2.2
4.2 Paying for the services

4.2.1 Initial application/complementary application

Management and testing fees related to examination services are invoiced in the framework of an initial or complementary ECAU and/or EChAU rating application. They are payable in one instalment, at the time at which the application is filed, for official registration.

Such fees will remain payable even if the ECAU and/or EChAU rating is not granted or extended or if the application is withdrawn during the examination.

4.2.2 Monitoring

Fees for annual services related to management and testing of ECAU and/or EChAU ratings are invoiced during the first quarter of each year and will remain payable in the event of non-renewal, withdrawal, cancellation or suspension of the ECAU and/or EChAU rating during the year.

4.2.3 Non-payment of amounts due

The applicant or holder of the ECAU and/or EChAU rating must pay all fees in accordance with the established terms of payment. Any failure on their part is an obstacle to the fulfilment by CSTB of the responsibilities of inspection and corrective action that are incumbent upon it hereunder.

If a first official notice by registered letter with acknowledgement of receipt does not result in the payment of all amounts due within one month, any established penalties may be applied for all of the products accepted for such holder.

4.3 Prices

Prices are reviewed annually, in the form of a price list drawn up by CSTB. This revision is reported by CSTB.

If holders refuse to recognise the annual revision of fees, they shall be deemed to have voluntarily terminated the ratings for their products.
